

AFB Vaccine for Honeybees

Dalan Animal Health is dedicated to developing transformative animal health solutions to support planet health and the world's food supply. Based out of the Innovation Gateway at The University of Georgia, we care deeply about enabling a more sustainable future for all by improving the health of essential animal species.

Dalan understands how immunity in honeybees works. This has allowed us to develop an industry-first method to impart protection and improve resilience to brood disease.

THE FIRST USDA APPROVED VACCINE FOR HONEYBEES*

- ✓ Non-GMO
- ✓ Safe for organic agriculture
- ✓ Chemical free
- ✓ No prescription required

3 Simple Steps to Immunity

The beekeeper administers the vaccine orally via queen candy

Step 1

The vaccine is poured into the queen candy and mixed thoroughly. The queen candy is fed to 6-10 attendant bees caged with a mated queen.

Step 2

As the candy is consumed, the vaccine particles are digested by the attendants and incorporated into the royal jelly, which is then fed to the queen bee.

Step 3

The ingested vaccine is transported to the queens ovaries and the eggs. When hatched, the larvae are primed against the disease by the vaccine.
